SUMMARY

Senior DevOps and SRE engineer with 8 years of hands-on experience across cloud-native, hybrid, and on-premises environments. Currently designing and operating observability, monitoring, and self-healing solutions at ADNOC in Abu Dhabi, where I'm responsible for the reliability, performance, and security of mission-critical workloads running on AKS, Azure App Services, and VM-based infrastructure. Day-to-day work centers on building APM and log-analytics solutions with Prometheus, Grafana, and Dynatrace; automating deployment and infrastructure delivery with Terraform, Ansible, and Azure DevOps pipelines; and applying SRE principles around availability, capacity, change management, and incident response. Comfortable working across Linux and Windows, across AWS, Azure, GCP, and VMware, and across Kubernetes and traditional VM stacks. Strong scripting background in Python, Bash, and PowerShell, plus consumption and integration of REST APIs for monitoring tooling. Driven by clean automation, reliable systems, and reducing toil for the teams I support.

EXPERIENCE

*ADNOC – Abu Dhabi National Oil Company, **DevOps and Observability Engineer (Contractor)***

May 2025 - Present

Own the observability and reliability of enterprise workloads running on AKS, Azure App Services, Azure Functions, IaaS, and on-premise systems — building dashboards, alerts, and SLO/SLI instrumentation across the stack. Stood up the monitoring stack (Prometheus, Grafana, and DynaTrace) for production and pre-production estates, including APM instrumentation, custom dashboards, log-analytics views, and alert routing to incident channels. Designed and run end-to-end YAML CI/CD pipelines in Azure DevOps for containerized, serverless, and VM-based deployments — including canary-style rollouts and rollback handling for releases that show problems in production. Automate infrastructure delivery using Terraform, Ansible-style patterns, Bicep, and ARM modules — provisioning AKS clusters, networking, identity, and supporting cloud resources in a version-controlled, repeatable way. Implement Observability-as-Code patterns to keep instrumentation, dashboards, and alert definitions in version control alongside application code. Lead L2/L3 production support, incident response, RCA, and post-incident reviews; have measurably improved MTTR and reduced repeat incidents through targeted fixes and better instrumentation. Embedded shift-left DevSecOps tooling (Fortify SAST/DAST, SonarQube, CodeDX, Black Duck SCA, container scanning) into release pipelines to enforce compliance and security gates. Manage cloud security and access governance using Managed Identities, RBAC, Azure Key Vault, and least-privilege principles aligned with ADNOC governance and audit standards. Administer RHEL servers and Hyper-V VMs - kernel-level troubleshooting, capacity planning, patching, and performance tuning. Build Python and Bash automation around the monitoring tooling — consuming REST APIs to push instrumentation, sync alerts, and integrate observability platforms with ServiceNow. Optimize cloud cost and runtime performance through right-sizing, autoscaling, storage lifecycle management, and ephemeral build execution. Authored CI/CD standards, observability playbooks, onboarding runbooks, and operational documentation that the wider engineering team uses as the baseline. Configure centralized monitoring and logging with Azure Monitor and Log Analytics, writing KQL queries for troubleshooting, alerting, and application performance analysis alongside Prometheus and Grafana dashboards. Manage secrets, TLS certificates, and identity using Azure Key Vault and Microsoft Entra ID (Azure AD) — service principals, Managed Identities, and RBAC role assignments for AKS workloads and CI/CD pipeline access. Ensure high availability and scalability of AKS and Azure workloads through multi-zone deployments, horizontal pod and cluster autoscaling, and disaster recovery planning with tested backup and failover procedures.

*NTT DATA, **DevOps and Cloud Engineer***

Oct 2020 - May 2025

Onboarded enterprise clients across multiple sectors onto Azure, AWS, and GCP — setting up secure landing zones, VPN/Interconnect connectivity, IAM hierarchies, and resource baselines. Designed, deployed, and operated Azure IaaS and PaaS workloads across production and non-production environments — covering VMs, storage, networking, load balancers, and security configurations. Built and maintained CI/CD pipelines across Azure DevOps, Jenkins, GitLab CI, and GitHub Actions for microservices, containers, and serverless services. Ran containerized applications on AKS, EKS, and GKE using Docker, Kubernetes, and Helm — improving deployment efficiency and platform reliability for customer engagements. Implemented observability with Prometheus, Grafana, and cloud-native monitoring — covering metrics, logs, and tracing — which reduced incident response times and surfaced reliability issues earlier. Worked closely with development teams to refine microservices architectures, streamline release workflows, and resolve cross-environment integration issues. Authored Terraform modules and ARM templates that became reusable building blocks across customer projects, cutting provisioning time substantially. Designed and supported HA, DR, and BCP solutions for enterprise workloads, including multi-region failover and backup strategies. Enforced security and compliance baselines across multi-cloud environments — supporting audits, vulnerability assessments, and remediation. Wrote a lot of Python, Bash, PowerShell, and CLI automation along the way — anything repetitive that could be removed from the team's day got automated.

KPMG, *Systems Engineer*

Dec 2019 - Jul 2020

Managed VMware vSphere/ESXi infrastructure — VM provisioning, resource allocation, snapshots, migrations, and capacity planning. Administered Windows Server environments, including user management, patching, backup, troubleshooting, and performance monitoring. Supported Azure cloud — VMs, storage, virtual networks, and network security configurations. Administered Active Directory: group policy, access control, and authentication support. Helped with cloud migrations from on-premise VMware to Azure, supporting hybrid integration work.

Suzlon Energy Ltd, *Systems Engineer*

Apr 2018 - Sep 2019

Provided L1/L2 infrastructure and application support — monitoring, incident resolution, user access management, and troubleshooting. Supported server and network operations: Windows and Linux administration, patching, backups, and documentation. Delivered desktop and end-user support — hardware/software installation, OS configuration, and system troubleshooting.

EDUCATION

Acharya Nagarjuna University

MBA

LICENSES & CERTIFICATIONS

Microsoft Certified: Azure Administrator Associate

Microsoft •

Microsoft Certified: DevOps Engineer Expert

Microsoft •

SKILLS

Observability and Monitoring: Dynatrace, Grafana, Prometheus, ELK-style logging, Azure Monitor, CloudWatch; APM, log analytics, dashboards, alerting, metric collection, instrumentation; familiarity with Splunk, AppDynamics, Datadog, Automic Orchestrator, and Zabbix (SNMP/network monitoring); Azure Log Analytics workspaces and KQL queries • Site Reliability Engineering: SLO/SLI design, availability and performance engineering, capacity planning, change management automation, emergency response, RCA, MTTR optimization, resilience testing, and canary and blue/green deployment patterns • Cloud Platforms: Microsoft Azure (AKS, App Services, Functions, IaaS/PaaS, Key Vault, and Azure Monitor), AWS (EKS, EC2, S3, IAM, and CloudWatch), GCP (GKE), VMware vSphere/ESXi, Hyper-V, hybrid and on-premises data centers • Infrastructure as Code: Terraform, Ansible, Azure Bicep, ARM Templates, Helm, AWS CloudFormation — including Observability-as-Code patterns for instrumentation and dashboard configuration • Containers and Orchestration: Kubernetes (AKS, EKS, GKE), Docker, Helm, Kustomize; familiarity with OpenShift; secure image lifecycle via ACR/ECR • CI/CD: Azure DevOps (YAML pipelines), Jenkins, GitLab CI, GitHub Actions, Bitbucket; pipeline design for containerized, serverless, and VM-based workloads; GitOps principles • Version Control: Git, Azure Repos, GitHub, GitLab, Bitbucket; branching strategies, pull request workflows, and code reviews • Scripting and Automation: Python, Bash, PowerShell, Shell scripting; REST API integration and consumption; Azure CLI, AWS CLI • DevSecOps: Fortify SAST/DAST, SonarQube, Black Duck (SCA), CodeDX; container and dependency scanning; secrets management (Azure Key Vault, KMS); identity and access management with Microsoft Entra ID (Azure AD), Managed Identities, and RBAC; least-privilege and Zero Trust principles • Operating Systems and Networking: Strong administration of Linux (RHEL, Ubuntu) and Windows Server; Active Directory; TCP/IP, HTTP/HTTPS, IPSec, VPN, DNS, firewalls, load balancing
